The deduced amino acid sequence was corroborated by chemical analysis of the protein.

The E. coli K-12 sequence and its annotations have been updated.
All of the ambiguous residues in our original submission have been resolved, and mais-assemblies in two repetitive regions have been realigned. The annotations have been improved and updated as well.
With this release we begin designating a version number for the annotated sequence, to assist in keeping track of corrections, updates, and other changes. This is version M52 (SEPT. 02, 1997). In addition, a revised notation has been instituted which assigns each gene (protein- or RNA-encoding) a unique numeric identifier beginning with a lowercase 'b' (in the 'label' field); this will remain constant through further updates, gene identifications, etc.
This sequence was determined by the E. coli Genome Project at the University of Wisconsin-Madison (Frederick R. Blattner, director). Supported by NIH grants HG00301 and HG01428 (from the Human Genome Project and NCHGR). The entire sequence was independently determined from E. coli K-12 strain MG1655.

Fredicted open reading frames were determined using Genemark software, kindly supplied by Mark Borodovsky, Georgia Institute of Technology, Atlanta, GA, 30332.
Fredicted open reading frames were determined using Genemark software, kindly supplied by Mark Borodovsky, Georgia Institute of Hernalis mark@amber.gatech.edu open reading frames were CGSC) database at Yale University, kindly supplied by Mary Berlyn. A public version of the database is accessible (http://cgsc.bology.yale.edu).
Annotation of the genome is an ongoing task whose goal is to make the genome sequence more useful by correlating it with other date.
Comments to the authors are appreciated updated information will be available at the E. coli Genome Project's World wide Web site (http://www.genetics.wisc.edu).

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     1. The sequence does not represent the sequence of the entire insert of this clone. It is shorter by 3062 bp because we submit only the unique sequence of the clone. In order to facilitate the joining of overlapping clones in the future for creation of larger contigs, we provide a small overlap (200 bp) between overlapping submitted clones. The 3' end of this sequence overlaps by 200 bp the 5' end of the sequence of BAC F19K23.
                                                                                                                                                                                                                                                  Direct Submission

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Сp
```

```
This sequence was determined as part of the E. coli Genome Project (Frederick Blattner, director) at the University of Wisconsin-Madison. Supported by award HG00301 from the NIH Human Genome Project. The entire sequence was independently determined from E. coli MG1655; overlaps and conflicts with other sequence determinations are annotated. The start of this entry overlaps the end of the entry ECOUWR9 (L19201) by 93 bp. NOTE: An update was submitted on 25-OCT-1993, reflecting a correction to the hemE
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   /product="catalase hydroperoxidase I"

ALIGNMENTS

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

double-stranded DNA (or its complementary strand or the corresp.

double-stranded DNA) which comprises one of the 7837 "GS" sequences

given in T19001-T26837 and which is able to hybridise to part of

human genomic DNA, cDNA or mRNA is claimed. The GS (Gene Signature)

CC sequences were obtained from 3'-directed cDNA libraries prepared

from various human tissues; synthesis of cDNA was initiated from the

3'-end of mRNA by using poly(T) as the sole primer. Since the 3'-

curranslated sequence; unique to a particular mRNA species, almost

curranslated sequence is unique to a particular mRNA species, almost

clal the 3'-oriented cDNAs hybridise with specific mRNAs. Each library

clas constructed so as to reflect accurately the relative abundance of

different mRNAs in the particular tissue from which it was derived.

The appearance frequency of a given GS in a cDNA library can be

determined (esp. using primers and probes derived from the GS

csequences) as a means of diagnosing abnormal cell function or for

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          This sequence comprises novel human fizizled gene 5 (HfZ5) that encodes a transmembrane receptor, frizzled-5 (see W31771), a what encodes a transmembrane receptor, frizzled family members have been identified in Drosophila, mouse, human and Caenorhabditis (see T89885-92) and are considered to be Wnt receptors. Wnt receptors can be used in a novel, claimed method of screening for compounds which modulate the binding of a Wnt polypeptide (secreted proteins involved in cell to-cell signalling) to a Wnt receptor. Wnt is involved in (mammary) cancer and other processes involving growth,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             gatctcagctcccgttccccaagcacactcctagctgctccagtctcagcctgggcagct

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Disclosure; page 46-47; 61pp; English.

This sequence comprises novel mouse frizzled gene 8 (Mf28)

This sequence comprises novel mouse frizzled 9 (see W31274),

that encodes a transmembrane receptor, frizzled-8 (see W31274),

a Wnt receptor (WATE). Novel frizzled family members have been

cidentified in Drosophila, mouse, human and Caenorhabditis (see

189885-92) and are considered to be Wnt receptors. Wnt receptors

can be used in a novel, claimed method of screening for compounds

which modulate the binding of a Wnt polypeptide (secreted proteins

involved in (mammary) cancer and other processes involving growth,

development and proliferation (both normal and abnormal).

Modulators identified by the claimed method are useful for

treatment of diseases related to these conditions.

Claim 3: Page 14: 23pp; English.

Oligourclectide probe Wil4-A consists of nucleotides 5-95 of N (051735). It hybridized to all spp. of mycobacterial spp. The probe may be useful as an initial screen for mycobacterial infection. See also Q51735-45 and Q51747-59.

See also Q51735-45 and Q51747-59.

Introducing random point mutations into nucleic acods -

Introducing random point mutations into nucleic acods -

By preph of single stranded template, annealing a primer, elongation,

maisincorporation, completion of molecules and screening.

Bisclosure; p; English.

Random point mutations were introduced into the alpha fragment of

E. coll beta-galactosidase. The wild type sequence was obtained as a single stranded template and an oligonucleotide was hybridised to

it to generate a popn of DNA molecules which terminate at all

consistent and generated in this way are used as primers for reverse transcriptase. Nucleotides are misincorporated by the transcriptase and the molecules are completed to forms that can be amplified and then expressed in a suitable host-vector system.

The sequence covers all 176 difft base substitutions, most of which
                          A method for treating airway disease in a subject has been produced, which involves the topical administration of an essentially adenosine free antisense oligonucleotide (ON) to the airway epithelium of the subject. The present sequence is an antisense oligonucleotide specific for the human interleukin 8, targeted at the initiation codon. The method can be used to treat airway diseases such as cystic fibrosis, asthma, chronic obstructive pulmonary diseases, bronchitis and other airway diseases characterised by an inflammatory response. By eliminating adenosine from the antisense ON, its liberation upon antisense degradation is prevented, thereby preventing adenosine-induced bronchoconstriction in patients with hyper-reactive airways. Sequence 172 BP; O A; 35 C; 42 G; 39 T;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       71 gtbggtcbgbbbgbtgtgcttbccttcbcbcbgbgctgcbgbbtcbggbbggctgccbb 130

The present sequence is an antisense obligonucleotide specific for the human IL4 receptor, targeted at the initiation codon. The method can be used to treat airway diseases such as cystic fibrosis, asthma, chronic obstructive pulmonary disease, bronchitis and other airway diseases characterised by an inflammatory response. Oligonucleotide probe MK14-A consists of nucleotides 5-95 of (Q51735). It hybridized to all spp. of mycobacteria tested, cross reacted to a few non-mycobacterial spp. The probe may be useful as an initial screen for mycobacterial infection. See also Q51735-45 and Q51747-59.

Districtions are, regarded to generate random TSAR (Totally Synthetic Affinity Reagents) peptides. This generic formula can also be represented as follows: X(NNB)10(TGC)2(NNB)42(NNB)8 (TGC)(NNB) or expresented as follows: X(NNB)10(TGC)2(NNB)10(TGC)2(NNB)8 (TGC)(NNB) or that are not specified further. Other generic sequences are shown in Q70466-68. Other specific peptides generated by these generic sequences are shown in R65151-54. TSARs are concatenated heterofunctional proteins or peptides, comprising at least two functional regions - a binding company with affinity for a ligand and a second effector peptide portion that is chemically or bloogically active. They may further comprise a linker peptide between the 2 domains. The oligonucleotides are also designed so that the expressed peptide contains 2 or 4 cysteine residues confer some degree of conformational rigidity to the peptides. The TSARs or compsising a TSAR binding domain can be used in vivo to deliver a chemically or biologically active molety, eg. metal conformations or madioisotope, peptide, toxin or enzyme, to the specific target or in, randioisotope, peptide, toxin or anzyme, to the specific target or complex methods of hybridoma formation or in vivo antibody production. The TSARs are easily characterised and have designed activity allowing direct and rapid detection in a screening process.
                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                   99
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Generic DNA sequence to generate a random TSAR-9 petide library.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             à
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Tidentifying proteins or peptide(s) which bind a ligand - by screening a recombinant vector library expressing fusion proteins

PT comprising a binding domain and an effector domain

Disclosure: Page 35: 255pp. English.

COMOTORIST a generic DNA Sequence used to generate random TSAR (Totally CY0468 is a generic DNA Sequence used to generate candom TSAR (Totally CY0468 is a generic DNA Sequence used to generic formula can also be represented as follows: X(NNB)11(TGC)(NNB)7(TGC)(NNB)10Y. X

CA and Y are flanking restriction sites (X is not the same as Y) that are not specified further. Other generic sequences are shown in Q70466-68.

CO ther specified further other generic sequences are shown in R65151-54. TSARS are concatenated by these generic sequences are shown in CR65151-54. TSARS are concatenated by these generic sequences are shown in CR65151-54. TSARS are concatenated by these generic sequences are shown in CR65151-54. TSARS are concatenated by these generic sequences are shown in CR65151-54. TSARS are concatenated by these generic sequences are shown in CR65151-54. TSARS are concatenated by these generic sequences are allowed and a second effector peptide portion that is chemically or biologically active. They may further comprise a linker of the the expressed peptide contains 2 or 4 cysteine residues positioned in, or flanking, the unpredicted or variant residues. These residues confer some degree of conformational rigidity to the peptides. The TSARS or comprising a TSAR binding domain can be used in vivo to deliver a chemically to biologically active molety, eg. metal ion, cadioisocope, peptide, toxin or enzyme, to the specific target or on the companiant or polyclonal antibodies and therefore circumvent the need for common leave methods of bubicides and degree of the production of macromolecules, eg.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                for complex methods of hybridoma formation or in vivo antibody production. The TSARs are easily characterised and have designed activity allowing direct and rapid detection in a screening process. Sequence 114 BP; 0 A; 2 C; 2 G; 2 T;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                77-APR-1995 (first entry)
Generic DNA sequence to generate a random TSAR peptide library.
TSAR; totally synthetic affinity reagent; synthetic; binding domain; effector domain; concateneated heterofunctional protein; linker; direct; rapid; detection; screening; treatment; generic; ss.
Synthetic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Disclosure; p; English.

Random point mutations were introduced into the alpha fragment of E.coli beta-galactorsidase. The wild type sequence was obtained as a single stranded template and an oligonuclectide was hybridised to it to generate a popn of DNA molecules which terminate at all possible nucleotide positions within a specified region. The variable 3' ends generated in this way are used as primers for treverse transcriptase. Nucleotides are misincorporated by the transcriptase and the molecules are completed to forms that can be amplified and then expressed in a suitable host-vector system. The sequence covers all 176 difft base substitutions, most of which see also P88575.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps

C70469 is a generic DNA Asquence used to generate random TSAR peptide

C705(NNB)62(NNB)2(TGC)(NNB)14(TGC)Y. A and Y are flanking restriction

Sites (X is not the same as Y) that are not specified further. This

Sequence generates peptides that are cloverleaf in structure. Other

C705(NNB)62(NNB)2(TGC)(NNB)14(TGC)Y. A and Y are flanking restriction

Sites (X is not the same as Y) that are not specified further. This

Sequence generates peptides that are cloverleaf in structure. Other

C705(NNB)62(NNB)2(TGC)(NNB)14(TGC)Y. A and Y are flanking restriction

C706(NNB)62(NNB)2(TGC)(NNB)14(TGC)Y. A and Y are flanking at least

Terentifying proteins or peptide(s) which bind a ligand - by screening a recombinant vector library expressing fusion proteins

PT Generifying proteins or peptide(s) which bind a ligand - by screening a recombinant vector library expressing fusion proteins

PT Comprising a binding domain and an effector domain

Disclosure, Page 35; 255pp; English.

CC 70467 is a generic DNA sequence used to generate random TSAR (Totally

CC Synthetic Affinity Reagents) peptides. This generic formula can also be

represented as follows: X(NNB) 16/TGC) (NNB) 12/(NNB) 16/TGC) (NNB) 12/(NNB) 16/TGC) (NNB) 12/(NNB) 16/TGC) (NNB) 12/(NNB) 12/(NNB) 16/TGC) (NNB) 12/(NNB) 1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  198 GCCGCCTCGCCCTTCCCCGGCTCCGCTCCCTCTGCCCCCTCGGGGTCGCGCGCGCCCACGAT 257

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Discussive; were so, supplied to generate random TSAR (Totally 70465) is a generic DNA sequence used to generate random TSAR (Totally 59 thetic Affinity Reagents) peptides. This generic formula can also be corpresented as follows: X(NNB)6(TGC)(NNB)112(MNB)14(TGC)(NNB)31. X or and Y are flanking restriction sites (X is not the same as Y) that are not specified further. Other generic sequences are shown in 070466-68. Conter specific peptides generated by these generic sequences are shown in R5151-54. TSARs are concatenated heterofunctional proteins or peptides, comprising at least two functional regions - a binding domain with a finity for a ligand and a second effector peptide portion that is comprising at least two functional regions - a binding domain with a finity for a ligand and a second effector peptide portion that is comprised between the 2 domains. The oligonucleotides are also designed so that the expressed peptide contains 2 or 4 cysteine residues positioned in, or flanking, the unpredicted or variant residues. These residues confer some degree of conformational rigidity to the peptides. The TSARs or comprising a TSAR binding domain can be used in vivo to deliver a chemically or biologically active molety, eg. metal ion, radioisotope, peptide, toxin or enzyme, to the specific target or on the conformational antibodies and therefore circumvent the need correction. The TSARs are easily characterised and have designed activity allowing direct and rapid detection in a screening process.
                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Identifying proteins or peptide(s) which bind a ligand - by screening a recombinant vector library expressing fusion proteins comprising a binding domain and an effector domain bisclosure; page 35, 255pp; English.

O70469 is a generic DNA sequence used to generate random TSAR peptide This generic formula can be represented as follows: X(TGC)(NNB)10-(TGC)(NNB)2(TGC)(NNB)14(TGC)Y. X and Y are flanking restriction sites (X is not the same as Y) that are not specified further. This sequence generates peptides that are cloverleaf in structure. Other generic sequences are shown in Q70465-68. Other specific peptides generated by these generic sequences are shown in R65150-54. TSARs are
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            273 CTCGCTGCTGCTCTTCCTCGCCTCGCACTGCTGCCTGGGCTCGGGCGCGCGGGCTCTT 332

P
concatenated heterofunctional proteins or peptides, comprising at least two functional regions - a binding domain with affairty for a ligand and a second effector peptide portion that is chemically or biologically active. They may further comprise a linker peptide between the 2 domains. The oligonucleotides are also designed so that the expressed peptide contains 2 or 4 cysteine residues positioned in, or flanking, the unpredicted or variant residues. These residues confer some degree of conformational rigidity to the peptides. The TSARs or compsns. comprising a TSAR binding domain can be used in vivo to deliver a chemically or biologically active molety, eg. metal ion, radioiscope, peptide, toxin or enzyme, to the specific target or on the cell. They can also replace the function of macromolecules, eg. monoclonal or polyclonal antibodies and therefore circumvent the need for complex methods of hybridoma formation or in vivo antibody production. The TSARs are easily
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö

Oldf6 is a generic DNA sequence used to generate random TSAR (Totally Synthetic Affinity Reagents) peptides. This generic formula can also be represented as follows:X(NNB)1(TGC)(NNB)10(TGC)2(NNB)4Z(NNB)8(TGC)(NNB) or the same as Y)

That are not specified further. Other generic sequences are shown in Chart are not specified further. Other generic sequences are shown in CON466-66. Other specific peptides generated by these generic sequences are shown in R65151-54. TSARs are concatenated by these generic sequences or peptides, comprising at least two functional regions - a binding companion with affinity for a ligand and a second effector peptide portion that is chemically or biologically active. They may further comprise a linker peptide between the 2 domains. The oligonucleotides are also designed so that the expressed peptide contains 2 or 4 cysteine residues confer some degree of conformational rigidity to the peptides. The TSARs or comprising a TSAR binding domain can be used in vivo to deliver a chemically or biologically active moiety, eg. metal ion, radioisotope, peptide, toxin or enzyme, to the specific target or monoclonal or polyclonal antibodies and therefore circumvent the need for monoclonal contains and therefore circumvent the need for
confer some degree of conformational rigidity to the peptides. The TSARs or compans. comprising a TSAR binding domain can be used in vivo to deliver a chemically or bloLogically active molety, eg. metal ion, radioisotope, peptide, toxin or enzyme, to the specific target or on the cell. They can also replace the function of macromolecules, eg. monoclonal or polyclonal antibodies and therefore circumvent the need for complex methods of hybridoma formation or in vivo antibody production. The TSARs are easily characterised and have designed activity allowing direct and rapid detection in a screening process.
                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     complex methods of hybridoma formation or in vivo antibody production.

The present sequence is an antisense oligonuclectide (ON) to the airway epitheliuum of the subject. The present sequence is an antisense oligonuclectide specific for the human endothelin-1, targeted at the infliation codon. The method can be used to treat airway diseases such as cystic fibrosis, asthma, chronic obstructive pulmonary disease, bronchitis and other airway diseases characterised by an inflammatory response. By eliminating adenosine from the antisense ON, its liberation upon antisense degradation is prevented, thereby preventing adenosine induced bronchoconstriction in patients with hyper-reactive airways.
The TSARs are easily characterised and have designed activity allowing direct and rapid detection in a screening process. Sequence 114 BP; 0 A; 4 C; 4 G; 4 T;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   113 bbbcbgcbgbgbgbbbbtcbtgbgcbbbtbbtccbttctgbbbbbbgggbtcbbbbcc 172

CATO470 is a generic DNA Sequence used to generate random TSAR (Totally
CATO470 is a generic DNA Sequence used to generate formula can also be
represented as follows: X(NNB)4(CAC)(NNB)4CAC)(NNB)8Z(NNB)6(CAC)(NNB)8

CATO52(NNB)Y: X and Y are flanking restriction sites (X is not the same
CATO52(NNB)Y: X and Y are flanking restriction sites (X is not the same
CATO52(NNB)Y: X and Y are flanking restriction sites (X is not the same
CATO52(NNB)Y: X and Y are flanking restriction sites (X is not the same
CATO52(NNB)Y: X and Y are flanking restriction sites (X is not the same
CATO52(NNB)Y: X and Y are flanking restriction sites (X is not the same
CATO52(NNB)Y: X and Y are flanking restriction sites (X is not the second
CATO52(NNB)Y: X and Y are flanking restriction sites (X is not they
CATO52(NNB)Y: X and Y are flanking constraint a least two functional
CATO52(NNB)Y: X and Y are flanking for a ligand and a second
CATO53(NNB)Y: X and Y are peptide between the 2 domains. The TSARS
CATO54(NNB)Y: X and Y are peptide between the 2 domains. The TSARS
CATO54(NNB)Y: X and Y are flanking domain can be used in vivo to
CATO54(NNB)Y: X and Y are flanking value also replace the function of macromolecules, eg.
CATO54(NNB)Y: X and Y are flanking and therefore circumvent the need
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             1;
                                                                    Example 5; Page 40; 71pp; English.

A method for treating airway disease in a subject has been produced, which involves the topical administration of an essentially adenosine free antisense oligonucleotide (ON) to the airway epithelium of the subject. The present sequence is an antisense oligonucleotide specific for chymase, targeted at the initiation codon. The method can be used to treat airway diseases such as cystic fibrosis, asthma, chronic obstructive pulmonary disease, bronchitis and other airway diseases characterised by an inflammatory response. By eliminating adenosine from the antisense ON, its liberation upon antisense degradation is prevented, thereby preventing adenosine-induced bronchoconstriction
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Generic DNA sequence to generate a random TSAR peptide library, TSAR; totally synthetic affinity reagent; synthetic; binding domain; effector domain; concatenated heterofunctional protein; linker; direct; rapid; detection; screening; treatment; generic; ss.
  Treatment of airway diseases such as asthma - by topically applying adenosine-free antisense oligo:nucleotide to airway epithelium of

Terbit Angolderies or peptide(s) which bind a ligand - by screening a recombinant vector library expressing fusion proteins comprising a binding domain and an effector domain proteins a binding domain and an effector domain proteins a binding domain and an effector domain proteins a peneric DNA sequence used to generate random TSAR (Totally Synthetic Affilinty Reagents) peptides. This generic formula can also be spresented as follows: X(NNB)[(GAC)(NNB)(GAC)(NNB)(CAC)(NNB)(CAC)(NNB)(CAC)(NNB)(CAC)(NNB)(CAC)(NNB)(CAC)(NNB)(CAC)(NNB)(CAC)(NNB)(CAC)(NNB)(CAC)(NNB)(CAC)(NNB)(CAC)(NNB)(CAC)(NNB)(CAC)(NNB)(CAC)(NNB)(CAC)(NNB)(CAC)(NNB)(CAC)(NNB)(CAC)(NNB)(CAC)(NNB)(CAC)(NNB)(CAC)(NNB)(CAC)(NNB)(CAC)(NNB)(CAC)(NNB)(CAC)(NNB)(CAC)(NNB)(CAC)(NNB)(CAC)(NNB)(CAC)(NNB)(CAC)(NNB)(CAC)(NNB)(CAC)(NNB)(CAC)(NNB)(CAC)(NNB)(CAC)(NNB)(CAC)(NNB)(CAC)(NNB)(CAC)(NNB)(CAC)(NNB)(CAC)(NNB)(CAC)(NNB)(CAC)(NNB)(CAC)(NNB)(CAC)(NNB)(CAC)(NNB)(CAC)(NNB)(CAC)(NNB)(CAC)(NNB)(CAC)(NNB)(CAC)(NNB)(CAC)(NNB)(CAC)(NNB)(CAC)(NNB)(CAC)(NNB)(CAC)(NNB)(CAC)(NNB)(CAC)(NNB)(CAC)(NNB)(CAC)(NNB)(CAC)(NNB)(CAC)(NNB)(CAC)(NNB)(CAC)(NNB)(CAC)(NNB)(CAC)(NNB)(CAC)(NNB)(CAC)(NNB)(CAC)(NNB)(CAC)(NNB)(CAC)(NNB)(CAC)(NNB)(CAC)(NNB)(CAC)(NNB)(CAC)(NNB)(CAC)(NNB)(CAC)(NNB)(CAC)(NNB)(CAC)(NNB)(CAC)(NNB)(CAC)(NNB)(CAC)(NNB)(CAC)(NNB)(CAC)(NNB)(CAC)(NNB)(CAC)(NNB)(CAC)(NNB)(CAC)(NNB)(CAC)(NNB)(CAC)(NNB)(CAC)(NNB)(CAC)(NNB)(CAC)(NNB)(CAC)(NNB)(CAC)(NNB)(CAC)(NNB)(CAC)(NNB)(CAC)(NNB)(CAC)(NNB)(CAC)(NNB)(CAC)(NNB)(CAC)(NNB)(CAC)(NNB)(CAC)(NNB)(CAC)(NNB)(CAC)(NNB)(CAC)(NNB)(CAC)(NNB)(CAC)(NNB)(CAC)(NNB)(CAC)(NNB)(CAC)(NNB)(CAC)(NNB)(CAC)(NNB)(CAC)(NNB)(CAC)(NNB)(CAC)(NNB)(CAC)(NNB)(CAC)(NNB)(CAC)(NNB)(CAC)(NNB)(CAC)(NNB)(CAC)(NNB)(CAC)(NNB)(CAC)(NNB)(CAC)(NNB)(CAC)(NNB)(CAC)(NNB)(CAC)(NNB)(CAC)(NNB)(CAC)(NNB)(CAC)(NNB)(CAC)(NNB)(CAC)(NNB)(CAC)(NNB)(CAC)(NNB)(CAC)(NNB)(CAC)(NNB)(CAC)(NNB)(CAC)(NNB)(CAC)(NNB)(CAC)(NNB)(CAC)(NNB)(CAC)(NNB)(CAC)(NNB)(CAC)(NNB)(CAC)(NNB)(CAC)(NNB)(CAC)(NNB)(CAC)(NNB)(CAC)(NNB)(CAC)(NNB)(CAC)(NNB)(CAC)(NNB)(CAC)(NNB)(CAC)(NNB)(CAC)(NNB)(CAC)(NNB)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       623 ACCGCTGCGCCCCGGTCATGTCCGCCTTCGGCTTCCCCTGGCCCGACATGCTTGAGTGCG 682

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          엄
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ŏ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Disclosure; were 55, 202pp; augustan.

Oldfolis a generic DNA sequence used to generate random TSAR (Totally Contract Affinity Reagents) peptides. This generic formula can also be comprehented as follows: X(NNB)16(TGC)(NNB)16(TGC)(NNB)18(TGC)(NNB)18.

Cand Y are flanking restriction sites (X is not the same as Y) that are not specified further. Other generic sequences are shown in Q70466-68.

Cher specified further other generic sequences are shown in Q70466-68.

Cher specified further of energied by these generic sequences are shown in G7151-54. TSARs are concatenated by these generic sequences are shown in G704151-54. TSARs are concatenated by these generic sequences are shown in G704151-54. TSARs are concatenated by these generic specifies or peptides.

Comprising at least two functional regions - a binding domain with a fightly for a lightly for a lightly active. They may further comprise a linker opeptide between the 2 domains. The oligonucleotides are also designed so that the expressed peptide contains 2 or 4 cysteine residues sociationed in, or flanking, the unpredicted or variant residues. These residues confer some degree of conformational rigidity to the peptides. The TSARs confers and also replace the function of macromolecules, eg.

Call. They can also replace the function of macromolecules, eg.

Complex methods of hybridoma formation or in vivo antibody production.

Call They are also replace the function or in vivo antibody production.

Call They are also replace the function or in vivo antibody production.

Call They are also replace the function or in vivo antibody production.

Call They are also replace the function or in vivo antibody production.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                 Generic DNA sequence to generate a random TSAR petide library. TSAR; totally synthetic affinity reagent; synthetic; binding domain; effector domain; concateneated heterofunctional protein; linker; direct; rapid; detection; screening; treatment; generic; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   P-SDB: R65153.

Identifying proteins or peptide(s) which bind a ligand - by screening a recombinant vector library expressing fusion proteins comprising a binding domain and an effector domain Disclosure; Page 35; 255pp; English.

PT FYDIA MODITAL AND ADDITAL WETCHING A LIGANG LUB PT THERLIFYING PROTECTIONS OF PEPTING AND ADDITAL WETCHING A BY SCREENING A EXCOMPLIANT VECTOR LIBRARY EXPRESSING FURSION PT COMPATISING A BAINGING ADMAIN and an effector domain proteins DISCLOSURE; PAGE 35, 255pp; English.

CC 070465 is a generic DNA Sequence used to generate random TSAR (Totally CC O70465 is a generic DNA Sequence seed to generate formula can also be represented as follows: X(NNB) 6/TGC)(NNB) 114(TGC)(NNB) 3Y. X and Y are flanking restriction SIGES (XINB) 114(TGC)(NNB) 3Y. A and Y are flanking restriction SIGES (XINB) 114(TGC)(NNB) 3Y. A concept specified further. Other generic sequences are shown in CNAFS are concatenated by these generic sequences are shown in CR SE5151-54. TSARS are concatenated heterofunctional proteins or peptides, comprising at least two functional regions - a binding domain with a first sequence at ligand and a second effector peptide portion that is chemically or biologically active. They may further comprise a linker of peptide between the 2 domains. The Oilgonucleotides are also designed conformational rigidity to the peptides. The TSARS or compers of morrolicated or variant residues. These residues confer some degree of conformational rigidity to the peptides. The TSARS or compers and also replace the function of macromolecules, eg.

CC deliver a chemically or biologically active molety, eg. metal ion, calloisotope, peptide, toxin or enzyme, to the specific target or on the color or monoclonal or polyclonal antibodies and therefore circumvent the need for componex methods of hybridoma formation or in vivo antibody production. The TSARs are easily characterised and have designed activity allowing direct and rapid detection in a screening process. Sequence 114 BP; 0 A; 2 C; 2 G; 2 T;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Identifying proteins or peptide(s) which bind a ligand - by screening a recombinant vector library expressing fusion proteins comprising a binding domain and an effector domain Disclosure; Page 36, 255pp; English.

070471 is a generic DNA sequence used to generate random TSAR (Totally Synthetic Affinity Reagents) peptides.This generic formula can also be represented as follows: X(NNB)6(CAC)(NNB)9(CAC)(NNB)Z(CAC)(NNB)4(CAC)2-(NNB)6(CAC)(NNB)(CAC)2 and Y are flanking restriction sites
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            630 GCAGCGGTCCTTCACCTGCACGCAGAGCGAGTGGCATGGCTGGATGGTCTCGTCTAGGTC 571

COTOSI (NEB) 12 And 12 And
generated by this and other generic sequences (Q70470-73) have invariant historiac sessitues incorporated into variant sequences. TSARs are inscriptorated into variant sequences. TSARs are concatenated heterofunctional proteins or peptides, comprising at least two functional regions - a binding domain with affinity for a ligand and a second effector peptide portion that is chemically or biologically active. They may further comprise a linker peptide between the 2 domains. The TSARs or compsns. comprising a TSAR binding domain can be used in vivo to deliver a chemically or biologically active moiety, eg. metal in, radioisotope, peptide, toxin or enzyme, to the specific target or monoclonal or polyclonal antibodies and therefore circumvent the need for complex methods of hybridoma formation or in vivo antibody activity allowing direct and rapid detection in a screening process.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Example 5; Page 39; 71pp; English.

A method for treating airway disease in a subject has been produced, which involves the topical administration of an essentially adenosine free antisense oligonucleotide (ON) to the airway epithelium of the subject. The present sequence is an antisense oligonucleotide specific for the substance P, targeted at the initiation codon. The method can be used to treat airway diseases such as cystic fibrosis, asthma, chronic obstructive pulmonary disease, bronchitis and other airway diseases characterised by an inflammatory response. By eliminating adenosine from the antisense ON, its liberation upon antisense degradation is prevented, thereby preventing adenosine-induced bronchoconstriction in patients with hyper-reactive airways.
